Access Control Electronic Locking Hardware and Accessories Door Entry Systems

## Motorised Automatic Multi-Point Locking System

### Operation

The top, middle and centre latches are retracted and returned by the motor.

Upon closing, the top and bottom latches are thrown mechanically to 20mm and deadlocked.

In this state, exit may be gained by use of internal handle.

Entry may be gained by key at all times.

Deadlock can be thrown by key or internal thumbturn (this locks out the motor to prevent entry by access control system).
